

The package {bigstatsr}: memory- and computation-efficient tools for big matrices stored on disk

Florian Privé (@privéfl)

eRum 2018

About

I'm a PhD Student (2016-2019) in **Predictive Human Genetics** in Grenoble.

Disease \sim DNA mutations + ...

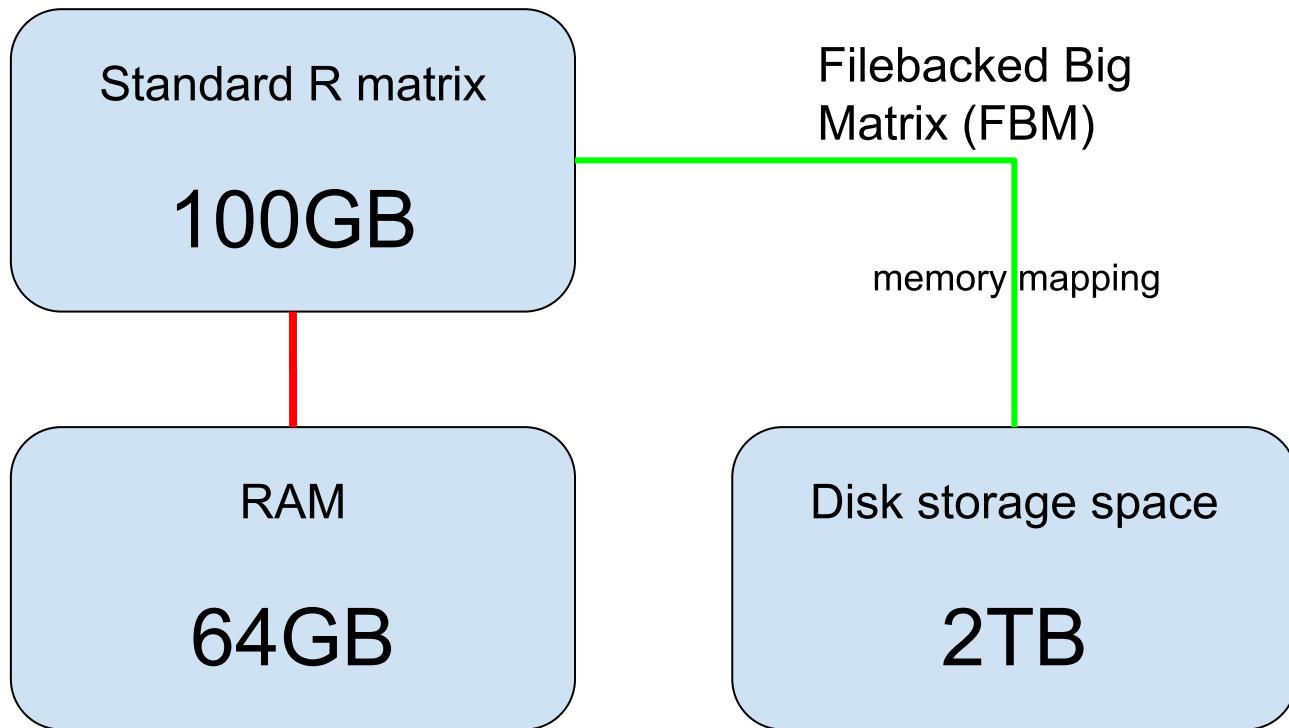

Very large genotype matrices

- previously: 15K x 280K, **celiac disease** (~30GB)
- currently: 500K x 500K, **UK Biobank** (~2TB)

But I still want to use ..

The solution I found

FBM is very similar to `filebacked.big.matrix` from package `{bigmemory}`.

Similar accessor as R matrices

```
X <- FBM(2, 5, init = 1:10, backingfile = "test")
```

```
X$backingfile
```

```
## [1] "/home/privef/Bureau/eRum-2018/test.bk"
```

```
X[, 1] ## ok
```

```
## [1] 1 2
```

```
X[1, ] ## bad
```

```
## [1] 1 3 5 7 9
```

```
X[] ## super bad
```

```
## [,1] [,2] [,3] [,4] [,5]
## [1,]    1    3    5    7    9
## [2,]    2    4    6    8   10
```

Similar accessor as R matrices

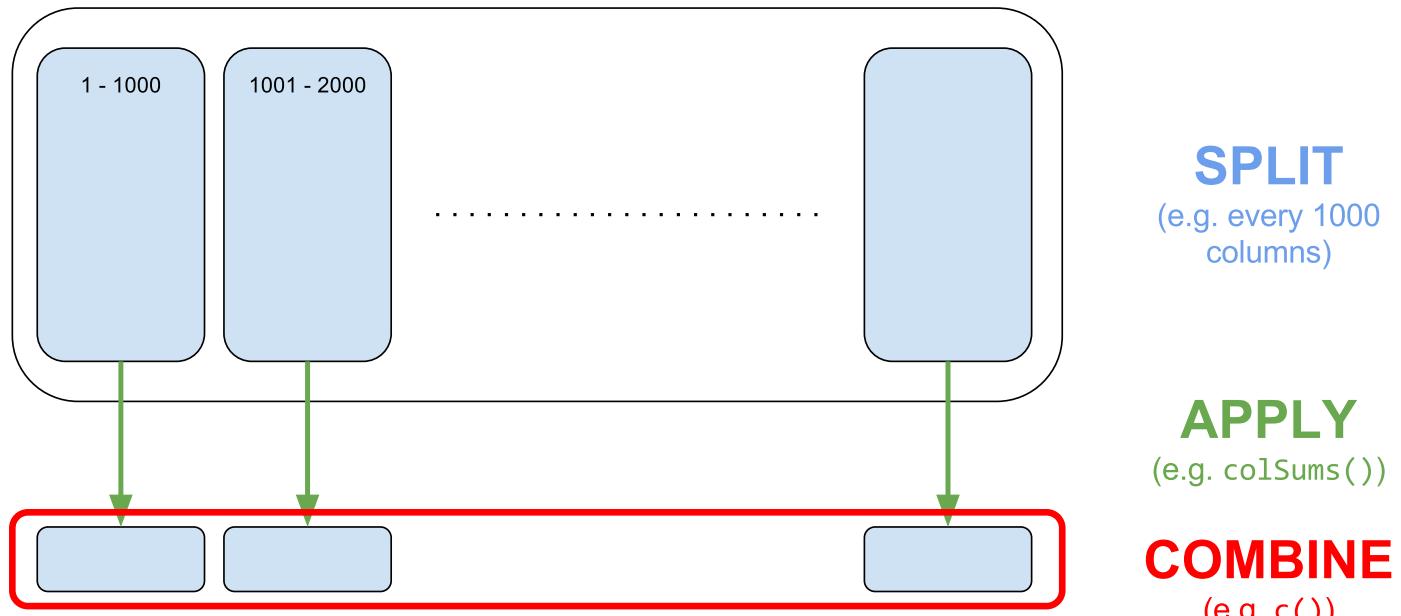

```
colSums(X[]) ## super bad
```

```
## [1] 3 7 11 15 19
```

Split-(par)Apply-Combine Strategy

Apply standard R functions to big matrices (in parallel)

Implemented in `big_apply()`.

Similar accessor as Rcpp matrices

```
// [[Rcpp::depends(BH, bigstatsr)]]
#include <bigstatsr/BMAcc.h>

// [[Rcpp::export]]
NumericVector big_columns(Environment BM) {

    XPtr<FBM> xpBM = BM["address"];
    BMAcc<double> macc(xpBM);

    size_t n = macc.nrow();
    size_t m = macc.ncol();

    NumericVector res(m);

    for (size_t j = 0; j < m; j++)
        for (size_t i = 0; i < n; i++)
            res[j] += macc(i, j);

    return res;
}
```

Partial Singular Value Decomposition

$15K \times 100K$ -- 10 first PCs -- 6 cores -- **1 min** (vs 2h in base R)

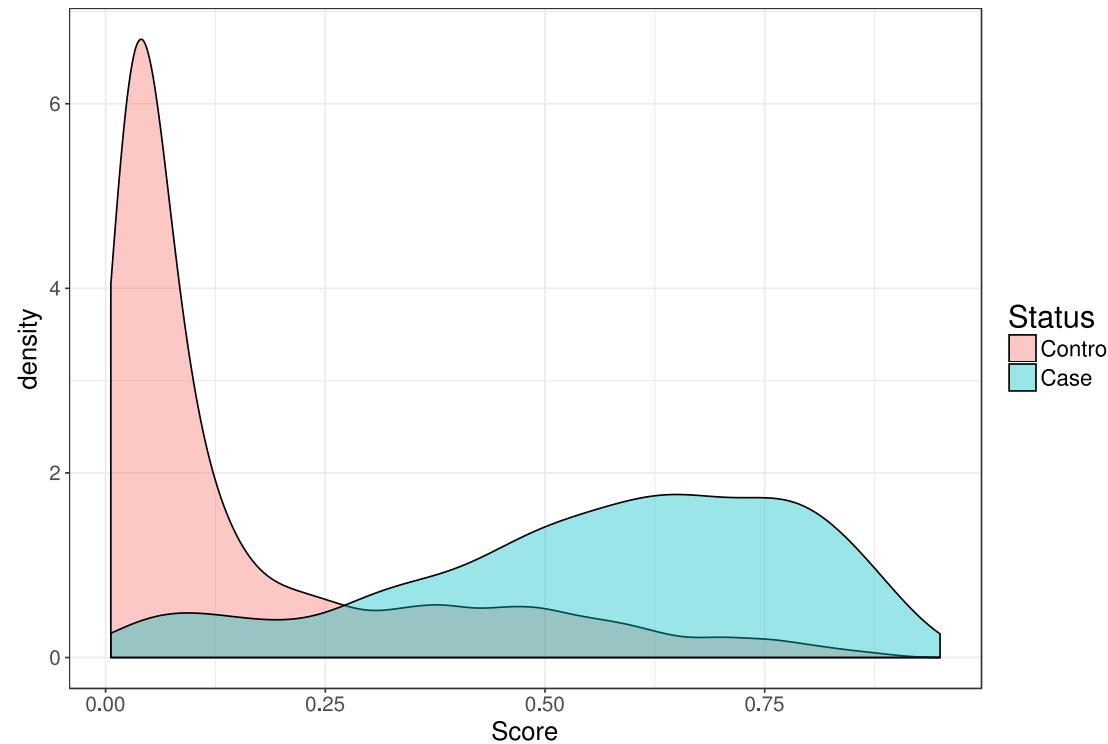

Implemented in `big_randomSVD()`, powered by R packages `{RSpectra}` and `{Rcpp}`.

Sparse linear models

Predicting complex diseases with a penalized logistic regression

$15K \times 280K$ -- 6 cores -- 2 min

Other functions

- matrix operations
- association of each variable with an output
- plotting functions
- read from text files
- many other functions..

Parallel

- most of the functions are parallelized (memory-mapping makes it easy!)
- you can parallelize your own functions with `big_parallelize()`

I'm able to run algorithms

on 100GB of data

in  on my computer

R Packages

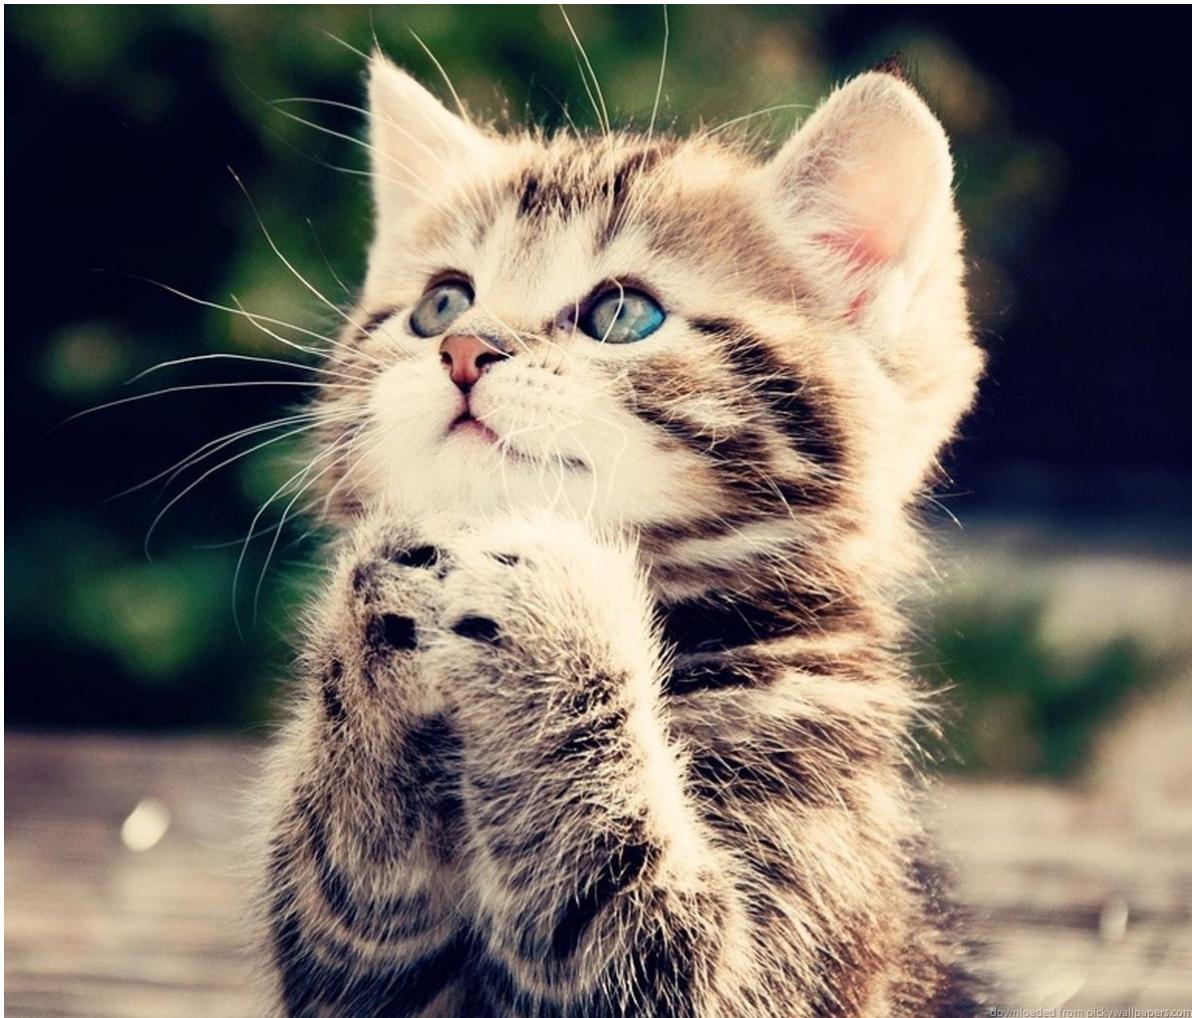

Efficient analysis of large-scale genome-wide data
with two R packages: **bigstatsr** and **bigsnpr** 

Florian Privé , Hugues Aschard, Andrey Ziyatdinov, Michael G B Blum 

Bioinformatics, bty185, <https://doi.org/10.1093/bioinformatics/bty185>

- {bigstatsr}: to be used by any field of research
- {bigsnpr}: algorithms specific to my field of research
